R - EXERCISE OVERVIEW

Week 2

- ***07 – Getting help***

  1. Use Google to find out how to update R without losing all your already installed packages. The procedure might differ depending on your operating system.
  2. Use Google to gather information on the difference between `library()` and `require()`?

- ***08 – Reading in data***

  Use the dataset `transactions.csv`. This dataset contains several variables with information on customer transactions.

  1. Set your working directory.
  2. Read in the CSV file (with the help of the `data.table` package). Make the data available for further use and name it `myData`.

- ***09 – Basic investigation of data***

  Use the dataset `transactions.csv`. This dataset contains several variables with information on customer transactions.

  1. Take a closer look at the data. I.e.,
     - look at the first / last lines of the dataset,
     - view the complete dataset, and
     - check the data types of all columns with `str()`).
  2. Use the `lubridate` package to format the `TransDate` column.
  3. Use `str()` to see if the change was made correctly. (How can you tell?)
  4. Use `summary()` to get the summary statistics.
  5. Save the `data.table` object to a csv-file with the name "transactions_backup.csv". Use the `fwrite` function.
